Chapter 1: Introduction

This chapter briefly describes the features of the Matrox Rapixo CXP board, as well as the software that can be used with the board.
Matrox Rapixo CXP board

Matrox Rapixo CXP is a family of high-performance PCIe frame grabbers that support image capture from high-resolution and high-speed video sources using the CoaXPress (CXP) communication standard. There are two models of the Matrox Rapixo CXP: Matrox Rapixo CXP base model, and Matrox Rapixo CXP Pro. There are two versions of the base model: Quad CXP-6 and Quad CXP-12, and one version of the Pro model: Pro Quad CXP-12. The Pro model of the board also comes with FPGA-based processing-offload capabilities (a Processing FPGA).
Acquisition features with Matrox Rapixo CXP
Matrox Rapixo CXP supports up to four simultaneous CoaXPress links to standard CoaXPress video sources. A CoaXPress link contains all the connections and components to capture from one video source. Each connection uses one of the independent acquisition paths on Matrox Rapixo CXP. Matrox Rapixo CXP supports frame and line-scan monochrome or color video sources. The color video sources can be RGB video sources or video sources with a Bayer color filter. Matrox Rapixo CXP can decode Bayer color-encoded images and perform color space conversions while transferring the image to the Host.

Matrox Rapixo CXP is available in the following CXP speeds: 6.25 Gbits/sec (for Quad CXP-6), or 12.5 Gbits/sec (for Quad CXP-12 and Pro Quad CXP-12). These speeds are the maximum per connection (depending on the cable length). Using multiple connections to implement a link (link aggregation), you can increase the bandwidth of the link to a maximum of 25 Gbits/sec for Quad CXP-6 and 50 Gbits/sec for Quad CXP-12 and Pro Quad CXP-12.

Processing capabilities
Matrox Rapixo CXP Pro features an on-board real-time processing FPGA device (Processing FPGA), which can be configured to offload and even accelerate the most compute-intensive part of typical image processing applications, without generating additional data traffic within the host computer (Host).

The Processing FPGA on Matrox Rapixo CXP Pro is a highly customizable Xilinx Kintex UltraScale FPGA*. The operations performed on-board are controlled using the Matrox Imaging Library (MIL) application-development software. Using MIL, the processing units (PUs) of an FPGA configuration can be rearranged to perform the operations in the required sequence, without having to necessarily generate a new FPGA configuration. You would typically use standard Matrox FPGA configurations. You can also chose to implement processing on your own, using the Matrox FPGA Development Kit (FDK) and C++, or you can employ Matrox’s FPGA design services to generate an application-specific FPGA configuration.

* The Processing FPGA also includes implementation for other functionality on the board, and is not used for processing only.
Before the Processing FPGA can process grabbed images, they must be stored in on-board memory. If images stored in Host memory are required, they can be streamed directly to the Processing FPGA for processing. Images and other data resulting from processing can be stored in on-board memory or streamed to the Host.

**Additional functionality**

In addition to the core video capture capabilities, Matrox Rapixo CXP incorporates a variety of features to simplify overall system integration. These features include:

- **Color space converter and image formatter.** This can convert data as it is being transferred to the Host. It can convert 8- or 16-bit monochrome or 24- or 48-bit packed BGR data to monochrome, packed BGR, packed BGRa, planar RGB, or YUV (YUYV) format. In addition, it can flip or subsample data sent to the Host.

- **Bayer decoder.** This can convert Bayer-encoded data to RGB using an average demosaicing algorithm. The following Bayer patterns are supported: GRBG, GBRG, BGGR, and RGGB.

- **Auxiliary, multi-purpose signals (32 with the cable adapter bracket installed).** These are non-video signals that can support one or more functionalities (for example, trigger input, rotary/linear encoder input, or timer output), depending on the auxiliary signal.

- **Integrated quadrature decoders.** These can decode input received from a rotary or linear encoder with quadrature output.

- **Programmable lookup tables (LUTs).** These allow Matrox Rapixo CXP to map data to precalculated values, before it is stored in memory.

- Matrox Rapixo CXP can provide up to 13 W of power per CoaXPress connection to any device that supports power-over-CoaXPress (PoCXp), at a nominal voltage of 24 V. The internal auxiliary 12 V power connector must be connected to the computer's power supply cable that has a 6-pin, compatible, mating 12 V connector.
On-board memory
Matrox Rapixo CXP is equipped with 4 Gbytes (Quad CXP-6/Quad CXP-12) or 8 Gbytes (Pro Quad CXP-12) of DDR4 SDRAM memory. This memory is accessed through the memory controller, and is used to store acquired images and images for or resulting from processing. The memory controller has multiple input ports, and it has a maximum data transfer rate of 14.9 Gbytes/sec (Quad CXP-6), 19.2 Gbytes/sec (Quad CXP-12), or 38.4 Gbytes/sec (Pro Quad CXP-12).

Data transfer
Matrox Rapixo CXP can send data to the Host at a maximum theoretical transfer rate of 8 Gbytes/sec. Optimum conditions for high speed transfer include using the board in a PCIe 3.x slot with 8 active lanes and using a 256-byte payload. DMA write performance is chipset and computer dependent, and is slightly affected by the image size and alignment in Host memory (frame start address and line pitch).

To measure the effective available bandwidth of the PCIe slot in your computer with your Matrox Rapixo CXP board, Matrox provides the Matrox Rapixo CXP Bench utility. This utility is accessible using the MILConfig utility, which is shipped with software that supports Matrox Rapixo CXP (for example, MIL).

Documentation conventions
This manual refers to all Matrox Rapixo CXP boards as Matrox Rapixo CXP. When necessary, this manual distinguishes between the boards using their full names (for example, Matrox Rapixo CXP Quad CXP-6, Matrox Rapixo CXP Quad CXP-12, or Matrox Rapixo CXP Pro Quad CXP-12), or their abbreviated forms (Quad CXP-6, Quad CXP-12, and Pro Quad CXP-12). Also note that, when the term Host is used in this manual, it refers to the host computer.

Software
To operate your Matrox Rapixo CXP, you can use one or more Matrox Imaging software products that supports the board. These are the Matrox Imaging Library (MIL) and its derivatives (for example, MIL-Lite and Matrox Intellicam). All Matrox software is supported under Windows; MIL is also supported under Linux when using Matrox Rapixo CXP. Consult your software manual for supported versions of these operating systems.
MIL

MIL is a high-level programming library with an extensive set of optimized functions for image capture, processing, analysis, transfer, compression, display, and archiving. Image processing operations include point-to-point, statistical, spatial filtering, morphological, geometric transformation, and FFT operations. Analysis operations support calibration, are performed with sub-pixel accuracy, and include pattern recognition (normalized grayscale correlation and Geometric Model Finder), blob analysis, edge extraction and analysis, measurement, image registration, metrology, character recognition (template-based and feature-based), code recognition and verification (1D, 2D and composite code types), bead (continuous strips of material) inspection, 3D reconstruction, classification, and color analysis.

MIL applications are easily ported to new Matrox hardware platforms and can be designed to take advantage of multi-processing and multi-threading environments.

MIL-Lite

MIL-Lite is a subset of MIL. It includes all the MIL functions for image acquisition, transfer, display control, and archiving. It also allows you to perform processing operations that are typically useful to pre-process grabbed images.

Matrox Intellicam

Matrox Intellicam is an interactive Windows program that allows for fast video source interfacing and provides interactive access to all the acquisition features of your Matrox boards. Matrox Intellicam also has the ability to create custom digitizer configuration format (DCF) files, which MIL and its derivatives use to interface with specific non-standard video sources. Matrox Intellicam is included with all Matrox Imaging software products.
To begin using your Matrox Rapixo CXP, you must have a computer with the following:

- An available conventional x8 (or x16*) PCIe 2.x slot (for Quad CXP-6) or 3.x slot (for Quad CXP-12 and Pro Quad CXP-12).
- Processor with an Intel 64-bit architecture, or equivalent.
- MIL or one of its derivatives. This software should be installed after you install your board.

Matrox does not guarantee compatibility with all computers that have the above specifications. Please consult with your local Matrox Imaging representative, local Matrox Imaging sales office, the Matrox web site, or the Matrox Imaging Customer Support Group at headquarters before using a specific computer.

Consult your software package for other computer requirements (for example, operating system and memory requirements).

* Note that you can also install Matrox Rapixo CXP in a x4 PCIe slot that has a mechanical x8 connector, or an open-ended x4 connector; however, the maximum transfer rate between Matrox Rapixo CXP and the Host is reduced by 50%.
Inspecting the Matrox Rapixo CXP package

You should check the contents of your Matrox Rapixo CXP package when you first open it. If something is missing or damaged, contact your Matrox representative.

**Standard items**

You should receive the following items:

- The Matrox Rapixo CXP board.

- One mDP-to-HD15 adapter cable. The cable has a mDP connector at one end, and a HD-15 connector at the other end.
Available separately
You might have also ordered one or more of the following:

- RAPACCKIT01, An accessory kit that includes one mDP-to-HD15 adapter cable and one dual HD-15 I/O bracket with ribbon cable.

- MIL or MIL-Lite. Matrox Intellicam is included with both of these software packages.

❖ You can purchase high-quality, 75 Ohm coaxial cables from the video source manufacturer, Belden Inc., or other third parties.

Handling components
The electronic circuits in your computer and the circuits on your Matrox Rapixo CXP are sensitive to static electricity and surges. Improper handling can seriously damage the circuits. Be sure to drain static electricity from your body by touching a metal fixture (or ground) before you touch any electronic component. In addition, do not let your clothing come in contact with the circuit boards or components.

Warning
Before you add or remove devices from your computer, always turn off the power to your computer and all peripherals.
Installation

The installation procedure consists of the following steps:

1. Complete the hardware installation procedure described in Chapter 2: Hardware installation.

2. Complete the software installation procedure described in the documentation accompanying your software package.

More information

For information on using multiple Matrox Rapixo CXP boards, refer to Chapter 3: Using multiple Matrox Rapixo CXP boards.

For in-depth hardware information, refer to Chapter 4: Matrox Rapixo CXP hardware reference; whereas for a summary of this information, as well as environmental and electrical specifications, and connector pinout descriptions, see Appendix B: Technical information.

This manual occasionally makes reference to a MIL-Lite function. However, anything that can be accomplished with MIL-Lite can also be accomplished with MIL.

Need help?

If you experience problems during installation or while using this product, refer to the support page on the Matrox Imaging web site: www.matrox.com/imaging/support. This page provides answers to frequently asked questions, as well as offers registered customers additional ways of obtaining support.

If your question is not addressed and you are currently registered with the MIL maintenance program, you can contact technical support. To do so, you should first complete and submit the online Technical Support Request Form, accessible from the above-mentioned page. Once the information is submitted, a Matrox support agent will contact you shortly thereafter by email or phone, depending on the problem.
Chapter 2

Hardware installation

This chapter explains how to install your Matrox Rapixo CXP board in your computer.
Installing your Matrox Rapixo CXP board

Before you install your Matrox Rapixo CXP board, some precautionary measures must be taken. Turn off the power to your computer and its peripherals, and drain static electricity from your body (by touching a metal part of the computer chassis).

Important

❖ Note that your board should be installed before you install your software.

Proceed with the following steps to install your board:

1. Remove the cover from your computer; refer to your computer’s documentation for instructions.

2. Check that you have an empty x8 (or x16) PCIe 2.x slot for Quad CXP-6, or a 3.x slot for Quad CXP-12 and Pro Quad CXP-12 in which to install your board*.

* Note that you can also install Matrox Rapixo CXP in a x4 PCIe slot that has a mechanical x8 connector, or an open-ended x4 connector; however, the maximum transfer rate between Matrox Rapixo CXP and the Host is reduced by 50%.
Matrox Rapixo CXP might drop frames if the PCIe slot does not have at least 8 active lanes (for example, if the board is connected to a x8 PCIe slot that has only four active lanes*). Verify with your motherboard manufacturer to find out whether your motherboard works efficiently with a x8 PCIe board, such as Matrox Rapixo CXP.

If you need to install the HD-15 cable adapter bracket, you will need an additional slot. This slot does not need to be adjacent to the Matrox Rapixo CXP board. In addition, the cable adapter bracket does not plug into a slot's connector; it attaches only to the back of the computer's chassis.

❖ Note that the external auxiliary I/O connectors on the cable adapter bracket are panel mount connectors. If you don't want to occupy an entire slot for the bracket, you can punch out two holes in the computer chassis, and then screw the connectors in the holes.

* After installing the board, you can verify in software the number of PCIe lanes that are currently active, using the MIL-Lite function MsysInquire() with M_PCIE_NUMER_OF_LANES. You can also verify this through the MILConfig, utility on the Boards page.
3. If there is a metal plate at the back of the selected slots, remove it. Keep the screw from the top of the plate to anchor your board and cable adapter bracket once they are installed.

4. Position your Matrox Rapixo CXP board in the selected PCIe slot. Align the connectors of your board with the opening at the back of the slot, and move the board until the connectors pass through the opening.

**Important**

When installing your Matrox Rapixo CXP board in a x16 PCIe slot, special care must be taken to avoid damaging the board. Some x16 PCIe slots have a connector with a retainer. You should avoid touching the latch of this retainer with the board. Alternatively, you can remove the latch from the retainer.

5. Once the input connectors are in the opening of the chassis, press the board firmly but carefully straight down into the connector of the slot.

6. Anchor the board using the screw that you removed in step 3.

7. Optionally, connect your computer's power supply cable that has a 6-pin, compatible, mating 12 V connector, to the internal auxiliary 12 V power connector.

   - You only need to connect the auxiliary power if you are using PoCXP-compliant video sources with Matrox Rapixo CXP.

8. If required, install the cable adapter bracket, as described in the section *Installing the cable adapter bracket*, later in this chapter.

9. Attach your video sources.
10. Turn on your computer.

   ✷ When you boot your computer under Windows, Windows’ Plug-and-Play system will detect a new Multimedia Video Device and you will be asked to assign it a driver. At this point, you should click on Cancel.

   Under Windows and Linux, the driver will be installed during the installation of Matrox Rapixo CXP software.

11. Disable active state power management (ASPM) for PCIe devices, to maximize the performance of Matrox Rapixo CXP. In the BIOS, disable all ASPM (or equivalent) settings (typically accessible from the Power management sub-menu of the Advanced Configurations menu). In addition, if the operating system has an ASPM for PCIe devices option, disable this option as well. For example, under Microsoft Windows 10, open the Power Options dialog box from the Windows Control Panel. For the currently selected power plan, click on Change Plan Settings and then click on Change Advanced Power Settings. In the presented dialog, expand PCI Express, and then expand Link State Power Management and set it to Off.

12. Under Microsoft Windows, set the power plan option to high performance to maximize the performance of Matrox Rapixo CXP and minimize the possibility of dropped frames. For example, under Microsoft Windows 10, open the Power Options dialog box from the Windows Control Panel and set the power plan option to High Performance.
Installing the cable adapter bracket

To install the cable adapter bracket, proceed with the following steps:

1. Make sure that your Matrox Rapixo CXP board is fastened to the computer chassis.

2. Attach the cable adapter bracket to internal auxiliary I/O connector 2/3 on the Matrox Rapixo CXP board. When attaching the flat ribbon cables of the adapter bracket, position the cable so that the black wire is on the same side as the bracket of the Matrox Rapixo CXP board.

3. Slide the bracket of the cable adapter bracket into the opening at the back of the selected slot.

4. Anchor the bracket to the chassis using the screw that you removed in the previous section.

Note that the external auxiliary I/O connectors on the cable adapter bracket are panel mount connectors. If you don’t want to occupy an entire slot for the additional bracket, you can punch out two holes in the computer chassis, and then screw the connectors in the holes.
Connecting video sources to Matrox Rapixo CXP

The Matrox Rapixo CXP board has the following connectors on its bracket:

- **CoaXPress video input connectors.** Used to receive video streams from the CoaXPress video sources. These connectors are also used to transmit CoaXPress trigger signals, as well as transmit and receive control and acknowledgment messages.

- **mDP connectors.** Used to connect the mDP-to-HD15 adapter cable. The HD-15 connector on the adapter cable is called an external auxiliary I/O connector. This connector is used to transmit and receive auxiliary signals.
To access the signals of internal auxiliary I/O connector 2/3, you can install the cable adapter bracket.

- **External auxiliary I/O connectors 2 and 3 (panel mount HD-15).** Each used to transmit and receive auxiliary signals.
Connecting to the CoaXPress video input connectors

When attaching video sources to your Matrox Rapixo CXP, you must use 75 Ohm, coaxial cables with a 12G rated HD-BNC male connector (plug). For the best performance, it is recommended that you use high-quality cables, such as Belden 1694A cables (which are good for typical cable lengths), or Belden 4794R cables (which maintain signal quality at greater lengths).

Note that a video source with multiple cables will have one master connection (typically attached to connector 1 on the camera) and the others as extension connections. Keep track of the video input connector to which you attach the master connection because you will need this information when using MIL-Lite (MdigAlloc() with M_DEVn) to identify the video source.

Matrox Rapixo CXP communicates with the video sources to identify which video source is connected to which input connectors.

❖ Note that if you are using more than one coaxial cable to connect to the same video source, the cables you choose must be of the same type and length.
The length of cable that you choose will affect the maximum data transmission rate. In general, for lengths greater than 40 m, the longer your cables, the lower the maximum possible bit rate. For example, when using high-quality, 100 m cables, the maximum possible bit rate is 3.125 Gbits/sec. Another factor that affects the bit rate is the quality of the cables that you choose.

**CoaXPress LEDs**
The four CoaXPress LEDs on the main bracket identify the state and activity of connected devices. The LEDs respect the JIIA CoaXPress Standard version 2.0 specification for connector indicator lamps. The typical sequence of LED states is as follows:

```
- **Orange, solid**: Matrox Rapixo-CXP is booting.
- **Red, slow pulse**: Matrox Rapixo-CXP driver has started, but nothing is connected.
- **Orange, fast flash**: Matrox Rapixo-CXP has detected a non-PoCXP compliant connection. Power is not provided.
- **Alternating green/orange, fast flash**: Matrox Rapixo-CXP has detected a PoCXP-compliant connection. Power is provided.
- **Green, solid**: Matrox Rapixo-CXP has established a connection with the device. Note that this requires an MdigAlloc() call. No data is being transferred.
- **Orange, slow pulse**: Matrox Rapixo-CXP is waiting for a grab trigger. Note that this state only occurs in triggered grab mode.
- **Green, fast flash**: Data is being transferred.
```
This is a typical sequence for the LED states on your Matrox Rapixo CXP. Refer to the CoaXPress LEDs section in Appendix B: Technical information for the complete list of possible LED states.

The following identifies the different timing used to define the LED flash or pulse states that can occur:

<table>
<thead>
<tr>
<th>LED indication</th>
<th>Hz</th>
<th>Timing (+/- 20%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast flash</td>
<td>12.5</td>
<td>20 msecs on, 60 msecs off</td>
</tr>
<tr>
<td>Slow flash</td>
<td>0.5</td>
<td>1 sec on, 1 sec off</td>
</tr>
<tr>
<td>Slow pulse</td>
<td>1</td>
<td>200 msecs on, 800 msecs off</td>
</tr>
</tbody>
</table>
Using multiple Matrox Rapixo CXP boards

This chapter explains how to use multiple Matrox Rapixo CXP boards.
Installation of multiple boards

You can install and use multiple Matrox Rapixo CXP boards in one computer.

Install each additional Matrox Rapixo CXP board the same way you installed the first board (refer to Chapter 2: Hardware installation). The number of Matrox Rapixo CXP boards that you can install is primarily dependent on the number of physical slots in your computer, and your BIOS; your BIOS establishes how many PCIe devices can be mapped to the PCIe memory space of your computer.

Using MIL-Lite, you have to allocate a MIL system for each board and allocate the resources of each MIL system. For more information, see MsysAlloc() with M_SYSTEM_RAPIXOCXP in the MIL Reference.

Simultaneous image capture from different boards

In addition to capturing images from multiple video sources with a single Matrox Rapixo CXP board, you can also simultaneously capture images from video sources attached to multiple Matrox Rapixo CXP boards. Note that the number of video sources from which you can simultaneously capture images is limited by the PCIe chipset on your computer.

The use of a high performance PCIe chipset is necessary to sustain PCIe transfers to Host memory. Ideally, a PCIe 3.x chipset should be used. A PCIe 3.x Host bus will optimize the speed of data transmission, and will minimize data loss. The list of platforms that are known to be compatible with Matrox Rapixo CXP is available on the Matrox web site, under the board’s compatibility list.

To measure the effective available bandwidth of the PCIe slot in your computer with the Matrox Rapixo CXP board, you can use the Matrox Rapixo CXP Bench tool accessible using the MILConfig utility. As a reference point, capturing from a 2K x 2K, 8-bit, 60 frames/sec video source will require a minimum bandwidth of 240 Mbytes/sec, plus an additional bandwidth margin of approximately 20%, for a bandwidth of 288 Mbytes/sec.
Matrox Rapixo CXP hardware reference

This chapter explains the architecture, features, and modes of the Matrox Rapixo CXP hardware.
Matrox Rapixo CXP hardware reference

This chapter provides information on the Matrox Rapixo CXP hardware. It covers the architecture, features, and modes of the board’s acquisition section. In addition, the chapter covers the Matrox Rapixo CXP hardware related to the formatting and transfer of data. A summary of the features of Matrox Rapixo CXP, as well as pin assignments for the various connectors, can be found in Appendix B: Technical information.

Acquisition path

This manual uses the term acquisition path to refer to a path that has the capability to, for example, capture a component or stream of the video input signal. The term independent acquisition path is used to refer to an acquisition path that can, if required, acquire data from a video source independently from another such path on the same frame grabber. On Matrox Rapixo CXP, each CoaXPress connection in a CoaXPress link uses a different acquisition path.

Digitizer

MIL-Lite uses the concept of a MIL digitizer to represent the acquisition path(s) with which to grab from one input source (one CoaXPress link on Matrox Rapixo CXP) of the specified type. When several MIL digitizers are allocated, their device number along with their DCF identify if they represent the same path(s) (but perhaps for a different input format) or independent path(s) for simultaneous acquisition.

Digitizer configuration format

To program the acquisition section, allocate a MIL digitizer using MdigAlloc() with an appropriate DCF (supplied or created) and digitizer device number. If you find a DCF file that is suitable for your video source, but you need to adjust some of the more common settings, you can do so directly, without adjusting the file, using the appropriate MIL-Lite function. For more specialized adjustments, use the Matrox Intellicam program to adjust the DCF file.
Chapter 4: Matrox Rapixo CXP hardware reference

Matrox Rapixo CXP Pro

- On-board memory (DDR4 SDRAM) 8 GB
- Processing FPGA (customizable block)
- Memory Controller 16/32 GB
- Processing Units 8 GB
- Host Interface
  - Color space converter & pixel formatter
  - Bayer decoder
  - DMA Write
  - DMA Read
- I/O data / Image data
- Host x8 PCIe 3.1 bus

* Note that this block represents only the customizable processing block of the on-board FPGA. Other functionality in this diagram is also implemented using the FPGA.
Matrox Rapixo CXP acquisition

Matrox Rapixo CXP can capture video from digital video sources compliant with the CoaXPress standard 2.0 specification (as well as 1.1 and 1.1.1). Matrox Rapixo CXP has four independent acquisition paths (CoaXPress connections). When a video source is connected to Matrox Rapixo CXP, the board communicates with the video source to determine the rate at which data will be transferred. Matrox Rapixo CXP can provide power-over-CoaXPress to attached video sources.

For each video source connected to the board, Matrox Rapixo CXP supports a CoaXPress trigger output signal, which is used to communicate exclusively with the video source. To communicate with other third-party devices, Matrox Rapixo CXP provides 32 auxiliary signals. Auxiliary input signals can be rerouted to the CoaXPress trigger output signal and the CoaXPress trigger input signal can be rerouted to auxiliary output signals.

Matrox Rapixo CXP supports monochrome, RGB color, and Bayer color-encoded acquisition. The board can perform color-conversion, flipping, and image subsampling.

Performance

The maximum data transmission rate that you can achieve depends on the length of your coaxial cable, the quality of the cable, your video source, as well as the type of PCIe slot in which you install your Matrox Rapixo CXP.

<table>
<thead>
<tr>
<th></th>
<th>Quad CXP-6 maximum</th>

<td>Up to 6.25 Gbits/sec</td>
<td>Up to 12.5 Gbits/sec</td>
</tr>
<tr>
<td>Data transfer speed to camera (per connection)</td>
<td>Up to 20.83 Mb/sec</td>
<td>Up to 41.66 Mb/sec</td>
</tr>
</tbody>
</table>

Effect of cable length

For lengths greater than 40 m, the longer the cables, the lower the maximum possible bit rate. High-quality cables, such as Belden 1694A cables or Belden 4794R cables, will allow for the highest possible bit rates. The table below
outlines the bit rates that you can expect to achieve at certain lengths, using Belden
1694A cables, as well as the bit rates possible when connecting to a single video
source using link aggregation (2, 3, and 4 cables).

<table>
<thead>
<tr>
<th>Length</th>
<th>Number of connections to video source</th>
<th>Maximum bit rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>130 m</td>

<td>2</td>
<td>25.0 Gbits/sec</td>
</tr>
<tr>
<td>40 m</td>
<td>4</td>
<td>50.0 Gbits/sec</td>
</tr>
</tbody>
</table>

**Effect of the type of PCIe slot**

A PCIe 3.x slot supports a higher data transmission rate than a 2.x slot. The
Quad CXP-12 requires a 3.x slot; a x4 PCIe slot will lower the data rate by half,
when compared to a x8 PCIe slot of the same base specification (3.x or 2.x). While
transferring data to the Host, these factors will reduce the maximum transmission
rate as follows.

<table>
<thead>
<tr>
<th>PCIe base specifications</th>
<th>Maximum data transmission rates</th>

<td>Theoretical transmission rate per lane</td>
</tr>
<tr>
<td>PCIe 2.x</td>
<td>4 Gbytes/sec</td>
</tr>
<tr>
<td>PCIe 3.x</td>
<td>8 Gbytes/sec</td>
</tr>
</tbody>
</table>

**Power-over-CoaXPress**

Matrox Rapixo CXP supports power-over-CoaXPress (PoCXP) compliant video
sources, and non-PoCXP compliant video sources. If Matrox Rapixo CXP is
connected to the computer’s power supply cable that has a 6-pin, compatible,
mating 12 V connector, the board can provide up to 13 W per connection, at a
nominal voltage of 24 V, to the devices connected to the CoaXPress input
connectors.

Matrox Rapixo CXP detects whether the video source is PoCXP-compliant. When
connecting to non-PoCXP compliant video sources, Matrox Rapixo CXP has
appropriate circuitry to ensure that no power is transmitted. To manually disable
the PoCXP circuitry and ensure that no power is sent to the device, you can use
the MIL-Lite function `MdigControl()` with `M_POWER_OVER_CABLE`. 
Matrox Rapixo CXP is also equipped with an overcurrent protection mechanism; if this fails, there is also a resettable fuse that can sustain a current of 1 A.

**Acquisition**

Matrox Rapixo CXP accepts 8-, 10-, 12-, and 16-bit video data. All data is transmitted in packets over a CoaXPress link.

The Matrox Rapixo CXP CoaXPress interface is responsible for decoding packets from the video sources, as well as buffering incoming data before it is written to memory. Video sources can be frame or line-scan video sources.

**CoaXPress trigger signals and control messages**

To communicate exclusively with the video source(s), Matrox Rapixo CXP supports CoaXPress trigger signals going to the camera and control messages. Trigger packets, which are sent to the camera, are virtually represented as trigger signals. Control messages constitute the basic communication mechanism between the video source(s) and the board.

For each video source connected to the board, Matrox Rapixo CXP supports a CoaXPress trigger output signal. A CoaXPress trigger output signal can be sent from the board to a video source to initiate image acquisition or to optionally control the exposure time.

For data coming from the camera (downlink) at speeds of up to 6.25 Gbits/sec (Quad CXP-6), the maximum trigger rate is approximately 150 KHz; for data coming from the camera at speeds of 12.5 Gbits/sec (Quad CXP-12 and Pro Quad CXP-12), the maximum trigger rate is approximately 300 KHz. Depending on your camera, you might have the ability to double the trigger rate. See your camera’s documentation for more details.

To send a trigger output signal to the camera, you use the MIL-Lite function `MdigControl()` with `M_IO_SOURCE + M_TL_...`

For more information on how to use the auxiliary input and output signals, refer to the *Auxiliary signals* section, later in this chapter.
## Auxiliary signals

This section describes the auxiliary signals available on Matrox Rapixo CXP.

### Auxiliary signals available on Matrox Rapixo CXP

The auxiliary signals of Matrox Rapixo CXP are acquisition path independent and can be used to initiate on-board events (inputs) or can be transmitted to third-party devices (outputs). You can also reroute an auxiliary input signal to a video source via the CoaXPress trigger output signal.

The following table summarizes the auxiliary functionality that Matrox Rapixo CXP supports using its auxiliary I/O signals. The table also documents the MIL constants to use.

<table>
<thead>
<tr>
<th>Functionality that can be routed or received</th>

</tbody>
</table>

* MIL constant, where m corresponds to the number in the row.
† There is no limit to the number of events that can be triggered simultaneously using the auxiliary input signals, nor is there a restriction on which auxiliary signal can be used to trigger an event.
‡ A rotary encoder with quadrature output transmits a two-bit code. The table entries 0 and 1, therefore, denote bit position.
Specifications of the auxiliary signals

Matrox Rapixo CXP has auxiliary signals in the following formats:

<table>
<thead>
<tr>
<th>Signal Format</th>
<th>Total # of signals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using both mDP connectors (no cable brackets attached)</td>
<td>With cable bracket</td>
</tr>
<tr>

<td>4</td>
</tr>
<tr>
<td>LVDS auxiliary output signals</td>
<td>2</td>
</tr>
<tr>
<td><strong>Total number of auxiliary signals</strong></td>
<td><strong>16</strong></td>
</tr>
</tbody>
</table>

When you route an external signal to an auxiliary signal or vice versa, verify that the external signal meets the electrical specifications of the auxiliary signal.

When an auxiliary input signal is received in TTL format directly, it will be clamped at a maximum of 5.7 V and at a minimum of -0.7 V to protect the input buffer. Typically, the signal should have a maximum of 5 V and a minimum of 0 V. A signal over 2 V is considered high, while anything less than 0.8 V is considered low.

The opto-isolated auxiliary input signals pass through an opto-coupler, a device that protects the board from outside surges and different ground levels, and allows the frame grabber to be totally isolated. The voltage difference across the positive and negative components of the signal must be between 4.71 V and 9.165 V for logic high, and between 0 V (recommended) and 0.8 V for logic low.

You can set the direction of an auxiliary I/O signal using the MIL-Lite function `MdigControl()` with `M_AUX_SIGNAL_MODE`.

You can set up the auxiliary signals in the DCF. Alternatively, for most commonly used functionalities, you can configure the auxiliary signals using the MIL-Lite function `MdigControl()` (for example, with `M_IO...`, `M_GRAB_TRIGGER...`, `M_TIMER...`, or `M_ROTARY_ENCODER...`).
**Timers**
Matrox Rapixo CXP has 4 16-bit timers, which operate on a specified clock source. Timer output signals allow you to control the exposure time and other external events related to the video source (such as a strobe). A timer output signal can be output on any of the auxiliary output signals or auxiliary I/O signals in output mode. A timer output can also be sent to a video source via the CoaXPress trigger output signal.

The timers can use one of the following as a clock source:

- A 125MHz internal clock source.
- A clock based on the output of another timer set in continuous mode.
- A clock based on the HSYNC or VSYNC signal of your camera.
- A clock based on the pixel clock signal of your camera.

To route a timer output on an auxiliary signal, use the MIL-Lite function `MdigControl()` with `M_IO_SOURCE + M_AUX_IO` set to `M_TIMERn`. To set up a timer, use `MdigControl()` with `M_TIMER_...`.

**Trigger**
You can use as a trigger any of the auxiliary input signals (or auxiliary I/O signals in input mode), or the CoaXPress trigger input signal. A trigger signal can be used to initiate image acquisition or prompt an on-board event.

To enable grabbing upon a trigger, use the MIL-Lite function `MdigControl()` with `M_GRAB_TRIGGER_STATE`. To set the signal used to trigger the grab, use `MdigControl()` with `M_GRAB_TRIGGER_SOURCE`. To start a timer upon a trigger, use `MdigControl()` with `M_TIMER_TRIGGER_SOURCE`.

**Quadrature decoder**
Matrox Rapixo CXP features 4 quadrature decoders. They are used to decode quadrature input received from linear or rotary encoders with a quadrature output. A rotary encoder is a device that provides information about the position and direction of a rotating shaft (for example, that of a conveyor belt); a linear encoder is a device that provides information about the position and direction of a moving sensor along a scale. Encoders with quadrature output transmit a two-bit code (also known as Gray code) on two pairs of LVDS wires for each change in position.
of the rotating shaft, or of the sensor along the scale. For a given direction, the encoder outputs the code in a precise sequence (either 00 - 01 - 11 - 10 or 00 - 10 - 11 - 01, depending on how the encoder is attached. If the rotating shaft, or sensor moving along the scale, changes direction, the encoder transmits the Gray code in the reverse sequence (00 - 10 - 11 - 01 or 00 - 01- 11 - 10, respectively).

Upon decoding a Gray code, the rotary decoder increments or decrements its 32-bit internal counter, depending on the direction of movement. You can configure which Gray code sequence represents forward movement and increments the counter; the reverse Gray code sequence will then represent the backward direction and decrement the counter. You can specify the direction of movement occurring when the Gray code sequence is 00 - 01 - 11 - 10, using MdigControl() with M_ROTARY_ENCODER_DIRECTION.

The rotary decoder supports encoder frequencies of up to 50 MHz. The encoders can only be connected to our LVDS auxiliary input signals. The LVDS receivers on Matrox Rapixo CXP can support, under most circumstances, RS-422 signaling; refer to the electrical specification of the LVDS auxiliary input signals in Appendix B: Technical information for requirements.

❖ Note that an external source must be used to power the rotary or linear encoder.

You can configure the rotary decoder’s settings, using the MIL-Lite function MdigControl() with M_ROTARY_ENCODER..., or by modifying the DCF file with Matrox Intellicam.

**User signals**

Auxiliary signals can also be used to transmit or receive application-specific user output and/or input.

If you want to start or stop an external event based on some calculation or analysis, you can manually set the state of any auxiliary output signal (or I/O signal set to output) to high or low. To do so, you set the state (on/off) of a bit in a user settable register (static-user-output register). When the bit is on, its associated auxiliary output signal will be high; when it is off, the auxiliary output signal will be low. This bit is referred to as a user-bit. To route the state of a user-bit to an auxiliary output signal, use MdigControl() with M_IO_SOURCE and M_USER_BITn; to set the state of a user-bit, use MdigControl() with M_USER_BIT_STATE.
Your application can also act upon and interpret the state of an auxiliary input signal (or I/O signal set to input). The state of an auxiliary input signal is not associated with a user-bit; you poll the state of the signal directly. To poll the state of an auxiliary input signal, use `MdigInquire()` with `M_IO_STATUS`. The state of an auxiliary input signal can also generate an interrupt; to do so, use `MdigControl()` with `M_IO_INTERRUPT_STATE` and then use `MdigHookFunction()` with `M_IO_CHANGE` to hook a function to this event (that is, to set up an event handler).

### On-board memory

Matrox Rapixo CXP is equipped with 4 Gbytes (Quad CXP-6/Quad CXP-12) or 8 Gbytes (Pro Quad CXP-12) of DDR4 SDRAM memory. This memory is accessed through the memory controller, and is used to store acquired images and images for or resulting from processing (Pro Quad CXP-12). The memory controller transfers data to and from memory at up to 14.9 Gbytes/sec for the Quad CXP-6, 19.2 Gbytes/sec for the Quad CXP-12 and up to 38.4 Gbytes/sec for the Pro Quad CXP-12.

Matrox Rapixo CXP has a default of 128 Mbytes of on-board memory mapped onto the PCIe bus. You can use a Host pointer to access this memory, or you can access it directly from another PCIe bus master; this memory is referred to as shared memory. To allocate a buffer in shared memory, use the MIL-Lite function `MbufAlloc...()` with `M_ON_BOARD + M_SHARED`.

### Data conversion

Data can be modified both before it is saved to on-board memory and as it is being transferred to the Host. For Matrox Rapixo CXP Pro, if you need to modify the data after it has been saved to on-board memory and before it is transferred to the Host, you will need to include appropriate processing units (PU) in your FPGA configuration.
**Lookup tables**
Matrox Rapixo CXP has on-board lookup tables (LUTs) that can precondition input data at acquisition time, before it is stored in memory.

The on-board programmable lookup tables (LUTs) can map 8-bit, 10-bit, and 12-bit data (monochrome or color). When a link is receiving color data, all bands of the data use the same specified LUT mapping. As soon as one link is receiving 12-bit data, all links (CoaXPress connections) share the same specified LUT mapping. Data of other depths are mapped through transparent LUTs. The LUTs are programmed using the MIL-Lite function `MdigControl()` with `M_LUT_ID`.

**Color space converter and image formatter**
As data from memory is transmitted to the Host, it passes through the color space converter and image formatter. The color space converter and image formatter can convert data in the following ways:

- **Subsampling.** Image data can be subsampled.

  The color space converter and image formatter can subsample in the horizontal and vertical directions by integer factors of 1 to 16. The color space converter and image formatter uses nearest-neighbor interpolation.

  You can use any of the following MIL-Lite functions to subsample image data:

  - `MdigControl()` with `M_GRAB_SCALE_X/Y` and the subsampling factor.
  - `MimResize()` with `ScaleFactorX` and `ScaleFactorY` and the subsampling factor.
  - `MbufTransfer()` with `M_COPY + M_SCALE` and setting the destination buffer size smaller than the original image.

  Note that Matrox Rapixo CXP does not support cropping in hardware. However, you can have image data cropped during transfer to Host using `MdigControl()` with `M_SOURCE_SIZE_X/Y` and `M_SOURCE_OFFSET_X/Y`. 
• **Flipping.** Images can be flipped horizontally or vertically, using the MIL-Lite function `MdigControl()` with `M_GRAB_DIRECTION_X/Y` or when calling `MimFlip()` from on-board buffer to Host.

• **Color space conversion.** The color space converter and image formatter formats an image based on its type and the bit-depth and color format of the destination buffer. You can set the bit depth and color format of the destination buffer when you allocate it using the MIL-Lite function `MbufAlloc...()`. The format of the source image is established in the DCF.

Image data can be converted as follows:

<table>
<thead>
<tr>
<th>Input format</th>
<th>Output format</th>
</tr>
</thead>
<tbody>
<tr>
<td>8-bit monochrome</td>
<td>16-bit monochrome</td>
</tr>
<tr>
<td></td>
<td>24-bit packed BGR</td>
</tr>
<tr>
<td></td>
<td>32-bit packed BGRa</td>
</tr>
<tr>
<td></td>
<td>48-bit packed BGR</td>
</tr>
<tr>
<td></td>
<td>16-bit YUV (YUYV)</td>
</tr>
<tr>
<td></td>
<td>24-bit RGB planar</td>
</tr>
<tr>
<td></td>
<td>48-bit RGB planar</td>
</tr>
</tbody>
</table>

The equations for the YUV16 conversion are described in the following table. The value of depth is either 8 or 16 when converting BGR24 or BGR48 data, respectively. Note that while performing BGR48-to-YUV color space conversion, the operations are carried out on 16-bit data; then, each resulting YUV component is bit-shifted right by 8 bits (>> (depth - 8) where the value of depth is 16).

<table>
<thead>
<tr>
<th>Color space conversion</th>
<th>Equations</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGR-to-YUV</td>
<td>• ( Y = (0.114B + 0.587G + 0.299R) &gt;&gt; (\text{depth} - 8) )</td>
</tr>
<tr>
<td></td>
<td>• ( U = (0.500B - 0.331G - 0.169R + 2^{(\text{depth}-1)}) &gt;&gt; (\text{depth} - 8) )</td>
</tr>
<tr>
<td></td>
<td>• ( V = (-0.081B - 0.419G + 0.500R + 2^{(\text{depth}-1)}) &gt;&gt; (\text{depth} - 8) )</td>
</tr>
</tbody>
</table>

**Bayer color decoder**

As data exits the color space converter and image formatter, it can pass through the Bayer color decoder. The Bayer color decoder converts Bayer color encoded images (GB, BG, GR, and RG pattern support) to multi-band RGB images using a 2x2 average demosaicing algorithm.
Processing FPGA

To reduce the number of image processing tasks that the Host CPU must perform, the Pro Quad CXP-12 has a Processing FPGA. The Processing FPGA on Matrox Rapixo CXP Pro is a highly customizable Xilinx Kintex UltraScale KU035*. The Processing FPGA can be configured to offload and even accelerate the most compute-intensive part of typical image processing applications, without generating additional data traffic within the host computer (Host).

Before the Processing FPGA can process grabbed images, they must be stored in on-board memory. If images stored in Host memory are required, they can be streamed directly to the Processing FPGA for processing. Images and other data resulting from processing can be stored in on-board memory or streamed to the Host.

The maximum peak bandwidth for images streamed directly to/from Host memory is 8 Gbyte/sec, as well as for images streamed to/from on-board memory.

Possible processing operations
To use the Processing FPGA, you must configure it with an FPGA configuration that defines the appropriate functionality. An FPGA configuration is a code segment that is used to program an FPGA. The following diagram shows the configurable FPGA components in an FPGA configuration.

*: Other functionality is also implemented through the FPGA, besides customizable processing, such as the timers and quadrature decoders.
You would typically use standard Matrox FPGA configurations. You can also choose to implement processing on your own, using the Matrox FPGA Developers Toolkit (FDK) and C++. If required, Matrox’s FPGA design services can be employed to develop an application-specific FPGA configuration.

Once the Processing FPGA is programmed, you can then make use of its functionality using MIL. Refer to Using MIL with a Processing FPGA chapter in the MIL User Guide for more information.

### Host interface

The Matrox Rapixo CXP PCIe Host interface is capable of high-speed DMA transfers to Host memory, or other memory mapped onto the PCIe bus. The DMA write engine of the Host interface is capable of performing the transfers without the help of the Host CPU.

Quad CXP-6 uses PCIe 2.1 and both Quad CXP-12 and Pro Quad CXP-12 use PCIe 3.1 technology to communicate with the Host. Under optimum conditions, Matrox Rapixo CXP can send data to the Host at a peak transfer rate of up to 8 Gbytes/sec. Optimum conditions include using the board in a PCIe 3.x slot with 8 active lanes, and using a 256-byte or 512-byte payload.

DMA write performance is chipset and computer dependent, and is slightly affected by the image size and alignment in Host memory.

The Matrox Rapixo CXP Host interface has four DMA write contexts, which act independently, simulating four DMA write engines running in parallel. The presence of multiple DMA contexts does not change the maximum bandwidth, but can help reduce latency.
Appendix A:
Glossary

This appendix defines some of the specialized terms used in the Matrox Rapixo CXP documentation.
Glossary

- **Acquisition path.**

  A path that has the components to, for example, digitize or capture a video input signal. Some video sources require multiple acquisition paths.

- **ASPM.**

  *Active State Power Management.* A hardware PCIe mechanism that autonomously controls power consumption of the PCIe connectors in a computer. The actual power consumed by a PCIe device depends on the PCIe traffic and on the power-saving level to which the PCIe slot is configured. The power-saving level of the PCIe slot is initialized by the operating system.

- **Auxiliary I/O signals.**

  *Auxiliary input/output signals.* Non-video digital signals that can support one or more functionalities depending on the auxiliary signal (for example, trigger input or timer output). These signals are also known as general purpose I/O signals or GPIO signals.

- **Bandwidth.**

  A term describing the capacity to transfer data. Greater bandwidth is needed to sustain a higher transfer rate. Greater bandwidth can be achieved, for example, by using a wider bus or by increasing the clock frequency at which an interface or a processing core operates (for example, increasing the DDR4 SDRAM clock frequency).

- **HD-BNC connector.**

  *High Definition Bayonet Neill-Concelman connector.* A common connector used for 75 Ohm coaxial cables. Its fastener uses L-shaped slots to ensure that the coaxial cable is secured to the Matrox Rapixo CXP board.
• CoaXPress.

An asymmetric high-speed communication standard used primarily for video and image data transfer. CoaXPress supports the transmission of video data, control signals, triggers, and power all on the same coaxial line. For each connection, CoaXPress supports downlink data rates of up to 12.5 Gbits/sec (1.25, 2.5, 3.125, 5.0, 6.25, and 12.5 Gbits/s) and an uplink data rate from 0.02 Gbits/s (21.33 Mbits/sec) to 0.4 Gbits/s (42.67 Mbits/sec).

• Contiguous memory.

A block of memory occupying a single, unbroken series of addresses.

• CXP.

See CoaXPress.

• DCF.

Digitizer configuration format. A file format that defines the input data format and, for example, how to accept or generate video timing signals, such as horizontal sync, vertical sync, and pixel clock.

DCF files have a .dcf extension.

• DDR4 SDRAM.

Double-data-rate type 4 synchronous dynamic random-access memory. A type of general purpose consumer RAM. DDR4 SDRAM allows for data transfer at very high speeds, which is important for I/O-bound functions. This type of memory is inexpensive, high density, and very efficient as long as the data is accessed contiguously.

• Digitizer configuration format.

See DCF.
• Dynamic range.

The range of values present in a buffer. An unsigned 8-bit buffer, for example, has an allowable range of 0 to 255; its dynamic range can be any range within these values.

• Exposure time.

Refers to the period during which the image sensor of a video source is exposed to light. As the length of this period increases, so does the image brightness.

• Frame.

A single image grabbed from a video source.

• Grab.

To acquire an image from a video source.

• Latency.

The time from when a command is sent to when its operation is started.

• Linear encoder.

A device that provides information about the linear position and direction of a moving sensor along a scale, either as an analog or digital code.

• LVDS.

Low-voltage differential signaling. LVDS offers a general-purpose, high bandwidth interface standard for serial and parallel data interfaces that require increased bandwidth at high speed, with low noise and power consumption.

• PCIe.

Peripheral Component Interconnect Express. The standard used for the computer bus that acts as an interface between hardware devices, such as Matrox Rapixo CXP, and your computer.
• Payload.

The amount of data transmitted to the PCIe bus within each data packet. Common payload sizes are 128, 256, 512, 1024, 2048, and 4096 bytes.

• PoCXP.

_Power-over-CoaXPress._ Power-over-CoaXPress is the term for power transmitted to a video source over a coaxial cable using the CoaXPress standard. Power can be provided to a video source, at up to 13 W per cable, at a nominal voltage of 24 V.

• Quadrature decoder.

A device that decodes input received from a linear or rotary encoder with quadrature output.

• Real-time processing.

The processing of an image at the same speed or faster than the speed at which images are grabbed. Real-time processing ensures that no frames are missed.

Also known as _live processing._

• Rotary encoder.

A device used to convert the angular position of a shaft or axle, to an analog or digital code.

• Timer output.

The signal generated by one of the programmable timers of the frame grabber. The timer output can be used to control external hardware. For example, it can be fed to the video source to control its exposure time or can be used to fire a strobe light.
Appendix B: Technical information

This appendix contains information that might be useful when installing your Matrox Rapixo CXP board.
Board summary

Matrox Rapixo CXP is a family of high-performance PCIe frame grabbers that support image capture from high-resolution, high-speed video sources that use the CoaXPress (CXP) communication standard. The Pro model of the board also comes with FPGA-based processing-offload capabilities (a Processing FPGA). There are two versions of the base model: Quad CXP-6 and Quad CXP-12 and one version of the Pro model: Pro Quad CXP-12.

Global information

• Operating system: See your software manual for supported versions of Microsoft Windows and Linux.

• Minimum computer requirements:

  - x8 (or x16)* PCIe 2.x slot (for Quad CXP-6) or 3.x slot (for Quad CXP-12/Pro Quad CXP-12).

  - Processor with an Intel 64-bit architecture, or equivalent.

  - A relatively up-to-date PCIe chipset. A chipset that supports the PCIe 2.x/3.x standard is preferable. The list of platforms that are known to be compatible with Matrox Rapixo CXP is available on the Matrox website, under the board’s PC compatibility list.

  - A proper power supply. Refer to the Electrical specifications section.

Matrox does not guarantee compatibility with all computers that have the above specifications. Please consult with your local Matrox Imaging representative, local Matrox Imaging sales office, the Matrox website, or the Matrox Imaging Customer Support Group at headquarters before using a specific computer.

* Note that you can also install Matrox Rapixo CXP in a x4 PCIe slot that has a mechanical x8 connector or an open-ended x4 connector; however, the maximum transfer rate between Matrox Rapixo CXP and the Host is reduced by 50%.
Technical features

• Has a x8 PCIe 2.1-compatible (Quad CXP-6) or 3.1-compatible (Quad CXP-12/Pro Quad CXP-12) Host interface.

• Supports 4 independent CoaXPress connections (up to 4 CXP streams total). Image data can be transmitted at up to 6.25 Gbits/sec (Quad CXP-6) or up to 12.5 Gbits/sec (Quad CXP-12/Pro Quad CXP-12) per connection.

• Supports frame and line-scan video sources. The minimum and maximum number of pixels per line are 33 bytes and 16 Mbytes, respectively.

• Supports video sources with a Bayer color filter. Bayer color encoded images (GB, BG, GR, and RG pattern support) are converted to multi-band RGB images using a 2x2 average demosaicing algorithm.

• Can convert 8- or 16-bit monochrome data or 24- or 48-bit packed BGR data to 8- or 16-bit monochrome, 24- or 48-bit packed/planar BGR, 32-bit packed BGRa, 16-bit YUV (YUYV), or 16-bit YCbCr format.

• Provides power-over-CoaXPress (PoCXP), with up to 13 W per connection at a nominal voltage of 24 V, to any PoCXP-compliant device. For PoCXP, the internal auxiliary 12 V power connector must be connected to the computer's power supply cable that has a 6-pin, compatible, mating 12 V connector. The board is equipped with an overcurrent protection mechanism and a resettable fuse. The fuse can sustain a current of 1 A.

• Has 4 Gbytes (Quad CXP-6/Quad CXP-12) or 8 Gbytes (Pro Quad CXP-12) of DDR4 SDRAM. Total memory bandwidth of up to 14.9 Bytes/sec (Quad CXP-6), 19.2 Gbytes/sec (Quad CXP-12), or 38.4 Gbytes/sec (Pro Quad CXP-12).

• Has on-board programmable lookup tables (LUTs). These can map 8-bit, 10-bit, and 12-bit data (monochrome or color). When a link is receiving color data, all bands of the data use the same specified LUT mapping. As soon as one link is receiving 12-bit data, all links (CoaXPress connections) share the same specified LUT mapping. Data of other depths are mapped through transparent LUTs.
• Can perform horizontal or vertical flipping.

• Can subsample image data using nearest neighbor integer subsampling factors of 1 to 16.

• Has a Processing FPGA (only Pro Quad CXP-12) for on-board, custom processing. Processing units (PUs) can be Matrox developed, or user developed using the Vivado HSL tool of the Xilinx Vivado Design Suite and Matrox FPGA Development Kit (FDK).

• Has 32 auxiliary signals (with the cable adapter bracket installed) that are path independent. Each auxiliary I/O connector (HD-15) provides the following number of signals:
  - 3 TTL auxiliary I/O signals (trigger input or user input signals, or timer output, re-routing of the CoaXPress trigger input, or user output signals).
  - 1 LVDS auxiliary output signal (timer output, re-routing of the CoaXPress trigger input, or user output signals).
  - 2 LVDS auxiliary input signals (trigger input, rotary/linear encoder input, or user input signals).
  - 2 opto-isolated auxiliary input signals (trigger input signals).

Auxiliary input signals (or auxiliary I/O signals set to input) can be rerouted to the CoaXPress trigger output signal and the auxiliary output signals.

The auxiliary input signals have interrupt generation capabilities. In addition, when the LVDS auxiliary input signals are used for rotary/linear encoder input, they can be debounced.
• Has 4 quadrature decoders. Each supports external 5 V linear or rotary encoders with quadrature output*, and frequencies of up to 50MHz.

• Has 4 general timers. Each timer is a 16-bit timer that can count up to 65,535 clock ticks before resetting. Each timer uses 125 MHz internal clock source.

• Supports coaxial cable lengths of up to 60m running at 6.25 Gbits/sec and 40m running at 12.5 Gbits/sec, depending on the number of cameras connected. See Appendix 4: Performance for more information.

• Has a CoaXPress LED for each CoaXPress input connector, to identify the status and activity of each connected device.

• Has 4 board status LEDs: board-power good, board configuration, PCIe speed/#lanes, and fallback board configuration.

• Has a fanless design (only Quad CXP-6/Quad CXP-12).

• Support for MIL license fingerprint and storage.

* Maximum differential swing of 3 V.
Electrical specifications

</tbody>
</table>
Dimensions and environmental specifications

- Dimensions of all Matrox Rapixo CXP boards: 16.76 L x 11.12 H x 1.871 W cm (6.6" x 4.376" x 0.737") from bottom edge of goldfinger to top edge of board. These values respect the dimensions of a PCIe half-length board.

- Ventilation: 200 LFM over board(s) (through the heat sink).

- Minimum/maximum ambient operating temperature*: 0°C to 55°C (32°F to 131°F).

- Minimum/maximum storage temperature: -40°C to 75°C (-40°F to 167°F).

- Operating relative humidity: up to 95% relative humidity (non-condensing).

- Storage humidity: up to 95% relative humidity (non-condensing).

* In the vicinity of the board.
Connectors on the Matrox Rapixo CXP board

On the Matrox Rapixo CXP board, there are several connectors. On the bracket of the main board, there are four CoaXPress video input connectors and two mDP connectors. In addition, close to the top edge of the main board, there is internal auxiliary I/O connector 2/3 and an internal auxiliary 12 V power connector.

The mDP-to-HD15 adapter cable connects to a mDP connector on the main bracket. If the cable is attached to the top mDP connector, the HD-15 connector at the end of this cable is called external auxiliary I/O connector 0; otherwise, it is called external auxiliary I/O connector 1. Note that only one mDP-to-HD15 adapter cable is included with the board; you can optionally purchase a second adapter cable.

The optional cable adapter bracket provides 2 additional external auxiliary I/O connectors (HD-15): auxiliary I/O connectors 2 and 3. The cable adapter bracket attaches to the internal auxiliary I/O connector 2/3.
CoaXPress video input connectors
The CoaXPress (CXP) video input connectors are 75 Ohm, 12G rated, high-density BNC (HD-BNC/micro-BNC) female connectors (jack). They are used to receive video input streams and send and receive CoaXPress trigger signals, as well as control and acknowledgment messages.

To interface with these connectors, use 75 Ohm coaxial cables with a 12G rated, HD-BNC male connector (plug). You can purchase high-quality, 75 Ohm coaxial cables from your video source manufacturer, Belden Inc., or other third parties. Note that these cables are not available from Matrox.

When using more than one CoaXPress cable to connect to the same video source, you must choose cables of the same type and length, to ensure that the cables have the same propagation delay.

Video sources can be connected to the CoaXPress video input connectors in any order. Matrox Rapixo CXP communicates with the video source(s) to identify which video source is connected to which connector(s).

External auxiliary I/O connectors
The external auxiliary I/O connectors on the mDP-to-HD15 adapter cable and the cable adapter bracket are high-density D-subminiature 15-pin (HD-15*) male connectors. The external auxiliary I/O connectors are used to transmit and receive auxiliary signals.

❖ The auxiliary I/O connectors on Matrox Rapixo CXP are not compatible with display devices. Connecting one of the HD-15 connectors to a VGA monitor or any other display device might damage both the device and the Matrox Rapixo CXP board.

❖ In addition, the mDP connectors directly on the Matrox Rapixo CXP bracket are not compatible with a DisplayPort source. Connecting one of the mDP connectors to such a device might damage both the device and the Matrox Rapixo CXP board.

* Previously referred to as DBHD-15, but more accurately known as DE-15.
The auxiliary signals are path independent; regardless of the acquisition path that is being used to grab images, any of the auxiliary signals can be used. For more information, see the Auxiliary signals section in Chapter 4: Matrox Rapixo CXP hardware reference chapter for supported functionality.

The pinout for auxiliary I/O connector 0 is as follows. Auxiliary I/O connectors 1, 2, and 3 have the same pinout as auxiliary I/O connector 0, except you must add 8, 16, or 24, respectively, to the number at the end of their hardware signal name and MIL constant. For example, AUX(TRIG)_TTL_IO_4 on connector 0 would be AUX(TRIG)_TTL_IO_12 on connector 1.

</tr>
</tbody>
</table>

These parts can be purchased from third parties such as Digi-Key Corporation (www.digikey.com).

**Internal auxiliary 12 V power connector**

The internal auxiliary 12 V power connector on Matrox Rapixo CXP is a standard 6-pin, 12 V connector. If this connector is attached to the computer’s power supply cable that has a 6-pin, compatible, mating 12 V connector, Matrox Rapixo CXP can provide power-over-CoAXPress (PoCXP) to the devices connected to the CoaXPress input connectors, at up to 13 W per connection at a nominal voltage of 24 V.

![Pinout Diagram]

The pinout for the auxiliary 12 V power connector is as follows:

Status LEDs on Matrox Rapixo CXP

Matrox Rapixo CXP has LEDs to display the status of the CoaXPress connections and the board.

CoaXPress LEDs

Matrox Rapixo CXP has one CoaXPress LED per video input (HD-BNC) connector. Each LED indicates the connection status between the device (camera) plugged into the LED’s associated connector and the Host (frame grabber). Each LED also indicates whether the device is sending data, and whether Matrox Rapixo CXP is transmitting power to the device.

<table>
<thead>
<tr>
<th>LED color and state</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Matrox Rapixo CXP is not receiving power.</td>
</tr>
<tr>
<td>Orange, solid</td>
<td>Matrox Rapixo CXP is booting. The PoCXP-device sensing circuitry has not been enabled yet.</td>
</tr>
<tr>
<td>Red, slow pulse</td>
<td>Matrox Rapixo CXP driver has started, but nothing is connected.</td>
</tr>
<tr>
<td>Alternating green/orange, fast flash</td>
<td>Matrox Rapixo CXP has detected a PoCXP-compliant connection.</td>
</tr>
<tr>
<td>Orange, fast flash</td>
<td>Matrox Rapixo CXP has detected a non-PoCXP compliant connection. PoCXP is disabled.</td>
</tr>
<tr>
<td>Alternating red/green, slow flash</td>
<td>The device is incompatible; PoCXP is enabled.</td>
</tr>
<tr>
<td>Alternating red/orange, slow flash</td>
<td>The device is incompatible. PoCXP is disabled.</td>
</tr>
<tr>
<td>Red, solid</td>
<td>Overcurrent was detected in the PoCXP circuitry, possibly because of a failure in the connected device or damage to the cable. Matrox Rapixo CXP stopped sending power to the device to avoid damaging the device or the board.</td>
</tr>
<tr>
<td>Green, solid</td>
<td>The device is compatible and Matrox Rapixo CXP has established a connection with the device (on the specified cable). Note that this requires an MdigAlloc() call. No data is being transferred.</td>
</tr>
<tr>
<td>Orange, slow pulse</td>
<td>Matrox Rapixo CXP is waiting for a grab trigger. Note that this state only occurs in triggered grab mode.</td>
</tr>
<tr>
<td>Green, fast flash</td>
<td>Matrox Rapixo CXP is receiving data from the connected device.</td>
</tr>
<tr>
<td>Red, 500 ms pulse</td>
<td>An error occurred during data transfer.</td>
</tr>
<tr>
<td>Red, fast flash</td>
<td>A CoaXPress system error occurred on the Matrox Rapixo CXP board. This type of error can prevent Matrox Rapixo CXP from receiving data. For example, an error will occur if the internal auxiliary 12 V power connector is not connected to a power source.</td>
</tr>
</tbody>
</table>
Board status LEDs
Matrox Rapixo CXP has four board status LEDs to indicate the status of the board: board-power good, board configuration, PCIe speed/#lanes, and fallback board configuration.

![LEDs diagram]

The table below outlines the possible colors for each LED and their definitions.

<table>
<thead>
<tr>
<th>LED</th>
<th>LED color and state</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Board-power good</td>
<td>Off/Red</td>
<td>One or more of the on-board voltage regulators did not start. If your computer is on and this LED state occurs, there is an issue with the voltage regulators on your Matrox Rapixo CXP. Contact Matrox technical support. Green</td>
</tr>
<tr>
<td>2. Board configuration</td>
<td>Red</td>
<td>The board is not configured. Green</td>
</tr>
<tr>
<td>3. PCIe speed/# lanes</td>
<td>Off</td>
<td>The type of slot cannot be established. The PCIe link is down. Blinking red</td>
</tr>
<tr>
<td>4. fallback board configuration</td>
<td>Off</td>
<td>The normal board configuration is being used. On</td>
</tr>
</tbody>

Regulatory Compliance

FCC Compliance Statement

Warning
Changes or modifications to these devices not expressly approved by the party responsible for the compliance could void the user’s authority to operate this equipment.

The use of shielded cables for connections of these devices to other peripherals is required to meet the regulatory requirements.

Note
These devices comply with Part 15 of FCC Rules. Operation is subject to the following two conditions:
1. These devices may not cause harmful interference, and
2. These devices must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for Class A digital devices, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of these devices in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his/her own expense.

Innovation, Science and Economic Development Canada Compliance Statement

These digital apparatuses do not exceed the Class A limits for radio noise emission from digital apparatuses set out in the Radio Interference Regulations of Innovation, Science and Economic Development Canada (ISED).

Ces appareils numériques n’émettent pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de Classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par Innovation, Sciences et Développement Économique Canada (ISDE).

EU Notice (European Union)

WARNING: These are class A products. In a domestic environment these products may cause radio interference in which case the user may be required to take adequate measures.
AVERTISSEMENT: Ces appareils sont des produits informatiques de Classe A. Lorsque ces appareils sont utilisés dans un environnement résidentiel, ces produits peuvent entraîner des interférences radioélectriques. Dans ce cas, l’usager peut être prié de prendre des mesures correctives appropriées.

This device complies with Directive 2014/30/EU for Class A digital devices. They have been tested and found to comply with EN55032/CISPR32 and EN55024/CISPR24 when installed in a typical class A compliant host system. It is assumed that these devices will also achieve compliance in any Class A compliant system.

Ces unités sont conformes à la Directive 2014/30/EU pour les unités numériques de Classe A. Les tests effectués ont prouvé qu’elles sont conformes aux normes EN55032/CISPR32 et EN55024/CISPR24 lorsqu’elles sont installées dans un système hôte typique de la Classe A. On suppose qu’ils présenteront la même compatibilité dans tout système compatible de la Classe A.
